

Overview of Jobs in Jenkins

What is Jenkins?

From Jenkins own home page:

"Jenkins is an [award-winning](#), cross-platform, **continuous integration and continuous delivery** application that increases your productivity. Use Jenkins to **build and test your software projects continuously** making it easier for developers to integrate changes to the project, and making it easier for users to obtain a fresh build. It also allows you to **continuously deliver** your software by providing powerful ways to define your build pipelines and integrating with a large number of testing and deployment technologies."

Currently we are using Jenkins to automate the integration of the kualu-research application
